

# Monitoring temperature at center of a mixing tank

### Problems

- It is not possible to heat the material properly without monitoring the temperature of the center of the tank.

### Advantages

- Appropriate heating became possible.
- Even while a mixing tank is revolving, measured data of a thermocouple is transmitted.

**Application** Measuring the temperature of the materials in the tank while it is mixing. Because the materials are easily affected by the air, the tank is set into the ground. Remote System transmits the measuring data of the thermocouple.
